PROJECT TITLE : A SMART EVENT PLANNER

◆ Brief Description:

The Event Management System is a complete web-based project designed to manage various aspects of organizing events like weddings, parties, corporate meetings, etc. The platform allows users to register, log in, and explore multiple event-related services such as food catering, invitation card design, entertainment, event vehicles, and venue selection. It also includes interactive galleries, pricing plans, and client reviews.

This system provides both frontend UI and backend functionalities like user authentication (login/register), data insertion into the database, and dynamic modal pop-ups for showcasing services (e.g., wedding food and vehicles). The application is built using HTML, CSS, JavaScript, PHP, and MySQL and styled primarily with Tailwind CSS for responsive and modern UI.

◆ Why This Project:

In today's world, managing events manually is time-consuming, error-prone, and often chaotic. This project aims to simplify and automate the entire event planning process by providing users with a centralized platform where they can:

- Discover available event services.
- Choose packages.
- View visuals (gallery, reviews).
- Communicate via contact forms.
- Register/log in to track their services.

This idea not only enhances user experience but also reduces the workload for event organizers.

◆ Real-Life Usefulness:

This Event Management System can be used in real-world businesses like:

- Event planning agencies
- Wedding planners
- Catering businesses
- Transport providers for events
- Corporate meeting organizers

With minimal adjustments and branding, this system can be deployed commercially to manage client requests, show packages, and receive online bookings.

◆ Technologies Used:

Technology	Purpose
HTML:	For structuring the web content and layout of pages.
CSS:	For styling components (colors, fonts, layouts, effects).
JavaScript:	For interactivity like modal handling (login/signup, service details).
Tailwind CSS:	For utility-first responsive design, ensuring modern UI.
PHP:	For backend scripting (user authentication, database handling).
MySQL:	For storing user data like registration info, login credentials, etc.
Swiper.js:	For implementing sliders and carousels in gallery and reviews.

Flowchart:

◆ **Features Implemented:**

- ☒ User Authentication System (Login, Register, Logout)
- ☒ Admin/User Role Management
- ☒ Frontend Modal Popups (for Signup/Login & Services)
- ☒ Event Service Display (Food Catering, Vehicles)
- ☒ Image Gallery, Testimonials, Price Plans
- ☒ Contact Form (static or extendable to backend)
- ☒ Responsive layout using Tailwind & CSS
- ☒ Interactive Navbar & Sliders

◆ **Future Scope:**

- Add online booking/payment gateway
- Expand admin dashboard (event approval, user management)
- Real-time chat/support
- SMS/email notifications for bookings
- Full backend for all forms (contact, service requests)
